The purpose of a production xmas tree is to control the flow of hydrocarbons from its. The surface pressure control is provided by a christmas tree which is installed on top of the wellhead with isolation valves and choke equipment to control the flow of well fluids during production. Wellheads are typically welded onto the first string of casing which has been cemented in place during drilling operations to form an integral, and xmas tree.

The difference between a wellhead and a christmas tree in the oil and gas industry:

- **Wellhead**: Oil and gas industry wellhead with valve armature.
- **Christmas Tree**: Schematic of an oil well system.

Wellhead systems serve as the termination point of casing and tubing strings. The surface pressure control is provided by a christmas tree which is installed on top of the wellhead with isolation valves and choke equipment to control the flow of well fluids during production. Wellheads are typically welded onto the first string of casing which has been cemented in place during drilling operations to form an integral. A valve located on the christmas tree that controls all flow from the wellbore. A correctly functioning master valve is so important that two master valves are fitted to most christmas trees. The upper master valve is used on a routine basis while the lower master valve provides backup or contingency function in the event that the normal service valve is leaking and needs replacement.
