GM vehicles started using throttle position sensors in the mid-1980s when computerized engine controls were introduced. All the sensors on the engine, the throttle position sensor is the only one that communicates driver input to the computer when the throttle pedal moves. The throttle sensor also moves in direct proportion to the throttle opening. Ford vehicles have a problem with the heat not working and the blend door. If the heater in your Ford Explorer is not working, you cannot reduce or raise the temperature because the blend door is binding in the stuck-open position. A quick call to your local Ford service manager should solve the problem.
