A Practical Approach to the Diagnosis and Management of
July 23rd, 2017 - Hair loss or alopecia is a common and distressing clinical complaint in the primary care setting and can arise from heterogeneous etiologies. In the pediatric population, hair loss often presents with patterns that are different from that of their adult counterparts. Given the psychosocial complications that may arise from pediatric alopecia, prompt diagnosis and management is particularly important.

The Diagnosis and Management of Alopecia
Other disorders include alopecia areata, telogen effluvium, cicatricial alopecia, and traumatic alopecias. The diagnosis is usually based on a thorough history and a focused physical examination.

Central centrifugal cicatricial alopecia – an approach to diagnosis and management

Central centrifugal cicatricial alopecia (CCCA) is a type of cicatricial scarring alopecia that presents as an area of permanent hair loss on the crown or vertex of the scalp that expands centrifugally. Clinical signs of inflammation, such as inflamed papules, pustules, erythema, or scarring, are common.

What is the best diagnostic approach to alopecia in women?

Scarring alopecia generally necessitates a biopsy. Identifying diffuse vs. focal alopecia can further narrow the differential diagnosis. The typical patient has diffuse nonscarring hair loss in no defined pattern, central thinning suggestive of androgenic alopecia. Consider telogen effluvium as the likely diagnosis.
